SUPERSTORE SALES DASHBOARD

Complete explanation of every KPI and chart

Purpose of this report

This document explains the dashboard's key performance indicators, monthly trend, regional sales, category mix, category profit, customer segments, top products, and filter controls. It also highlights what the results may mean for business decisions.

Important: Values are read from the screenshots supplied. Some figures are rounded, and some product names are shortened by the chart labels. Interpretations are descriptive; the dashboard alone does not prove why a result occurred.

1. Dashboard overview

The dashboard provides a high-level view of Superstore sales performance. It combines summary KPIs with charts that answer different business questions: how much was sold, how profitable the business was, when sales changed, which regions and categories contributed, which customer segments purchased most, and which products generated the highest sales.

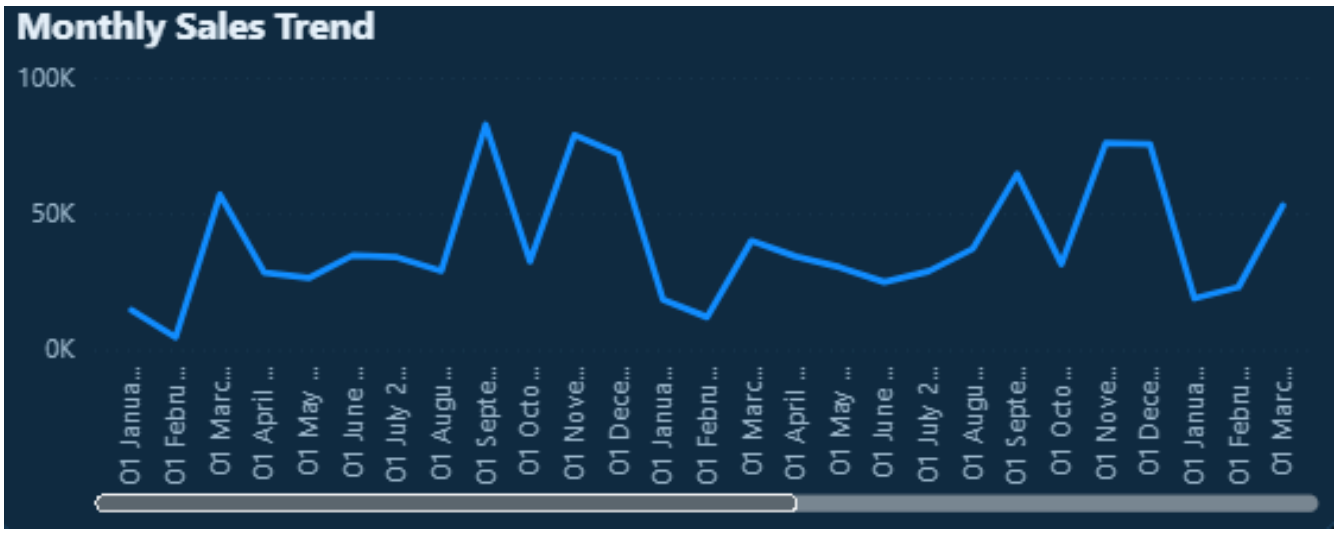

The visible report filters are **Year**, **Region**, **Category**, and **Segment**. Selecting a filter changes the figures and charts to show only the selected portion of the data. The displayed values should therefore always be interpreted together with the current filter selections.

2. KPI cards — summary performance

KPI	Displayed value	Meaning and interpretation
Total Sales	2M	The overall sales revenue shown by the dashboard. It represents the value of products sold, not the profit
Total Profit	275K	The profit amount reported after the costs included in the dataset's profit calculation. It indicates the busine
Total Orders	4,627	The number of orders recorded. It helps measure transaction volume and can be compared with sales to u
Total Quantity	35K	The total number of product units sold. This measures sales volume rather than revenue.
Average Order Value	460.80	Average sales value per order. A higher value can result from larger baskets, higher-priced products, or a
Profit Margin (%)	12.9%	The percentage of sales retained as profit under the dashboard's margin calculation. It is a useful indicator

How to explain the KPI section: "The dashboard reports approximately 2 million in sales and 275 thousand in profit from 4,627 orders and 35 thousand units. The average order value is 460.80, while the reported profit margin is 12.9%. Together, these cards summarise revenue, order volume, sales quantity, and profitability."

3. Monthly Sales Trend — line chart

What the chart shows: The line chart plots sales month by month across the period visible in the dashboard. The horizontal axis represents months and the vertical axis represents sales, marked in thousands (K). A higher point means more sales in that month; a lower point means fewer sales.

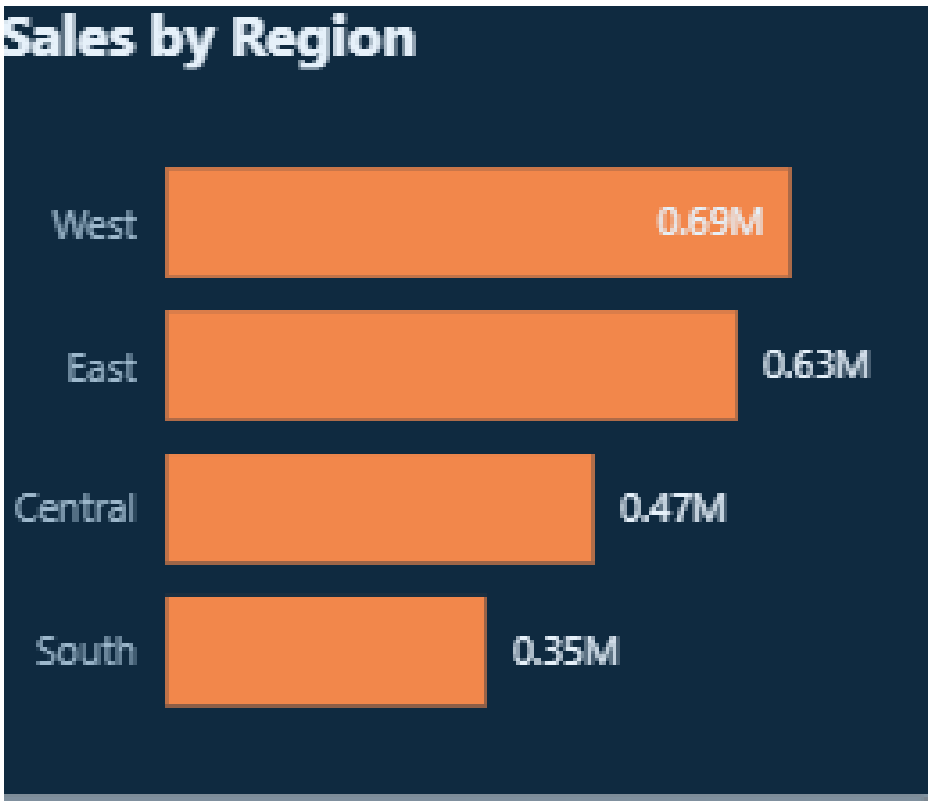

Interpretation:

- Sales fluctuate considerably rather than remaining at one steady level.
- Several visible peaks rise to roughly 75K–85K, indicating months with stronger sales.
- Some months fall close to 10K–20K, showing comparatively weaker sales periods.
- The repeated rises and falls suggest that monthly performance should be monitored for possible seasonality, promotions, demand changes, or supply constraints. The chart alone cannot identify the cause.

Business use: Use the trend to plan inventory, staffing, purchasing, and promotional campaigns. Investigate unusually low months and identify what happened during high-performing months so successful practices can be repeated.

Presentation line: “The monthly sales trend is not uniform. It contains clear peaks and dips, so the business should study the months with the strongest and weakest sales and plan stock and marketing accordingly.”

4. Sales by Region — horizontal bar chart

What the chart shows: It compares total sales across four regions. Longer bars indicate higher sales.

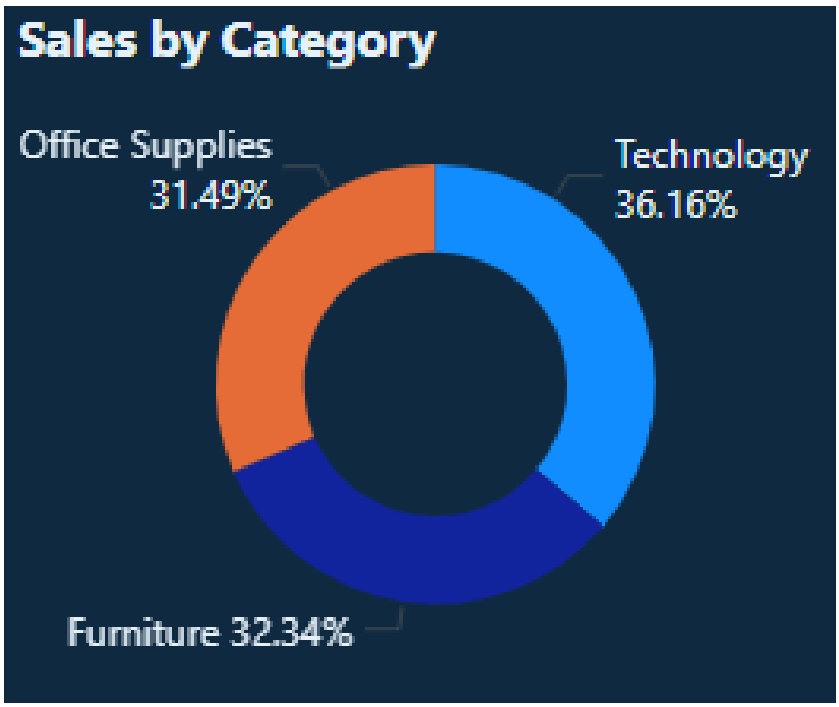

Region	Sales shown	Interpretation
West	0.69M	Highest sales contribution among the four regions.
East	0.63M	Second-highest sales; also a major contributor.
Central	0.47M	Lower than West and East, with room to investigate growth opportunities.
South	0.35M	Lowest sales contribution in this comparison.

Interpretation: West leads with about 0.69M, followed by East at 0.63M. Central contributes about 0.47M and South about 0.35M. West and East are the strongest sales regions in the displayed view.

Business use: Compare stock availability, customer demand, product mix, delivery performance, and sales coverage across regions. The lower sales in South and Central are opportunities to investigate, not automatic proof of poor performance; market size and customer mix may differ.

Presentation line: “West is the top-performing region in sales, followed by East. Central and South contribute less, so the company can examine regional demand and sales strategies to identify growth opportunities.”

5. Sales by Category — doughnut chart

What the chart shows: The doughnut chart divides total sales among Technology, Office Supplies, and Furniture. Each percentage represents that category's share of the displayed sales.

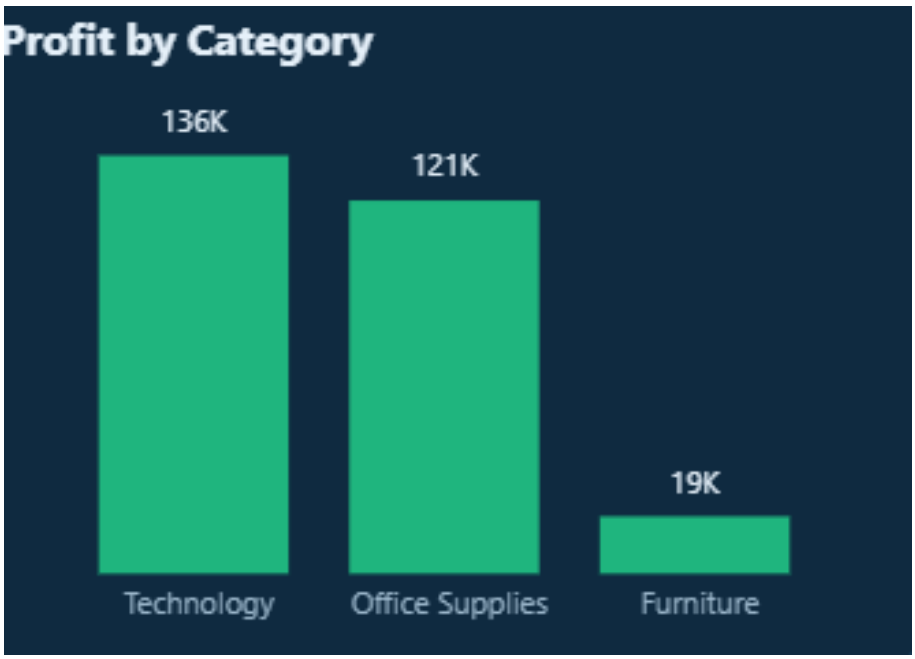

Category	Share of sales	Interpretation
Technology	36.16%	Largest share of sales in the displayed view.
Office Supplies	31.49%	Second-largest share; a substantial part of revenue.
Furniture	32.34%	Close to Office Supplies and contributes nearly one-third of sales.

Interpretation: Technology contributes the largest sales share at 36.16%. Furniture contributes 32.34%, and Office Supplies contributes 31.49%. The distribution is relatively balanced; no single category accounts for a majority of sales.

Business use: Maintain availability across all three categories while giving attention to Technology's larger revenue share. Category sales should be reviewed together with profit, because a category that sells a lot may not necessarily produce the highest profit.

Presentation line: "Technology contributes the highest share of sales at 36.16%, while Furniture and Office Supplies also make significant contributions. The sales mix is fairly balanced across the three categories."

6. Profit by Category — column chart

What the chart shows: The vertical bars compare the profit generated by each product category. The value labels are shown in thousands (K).

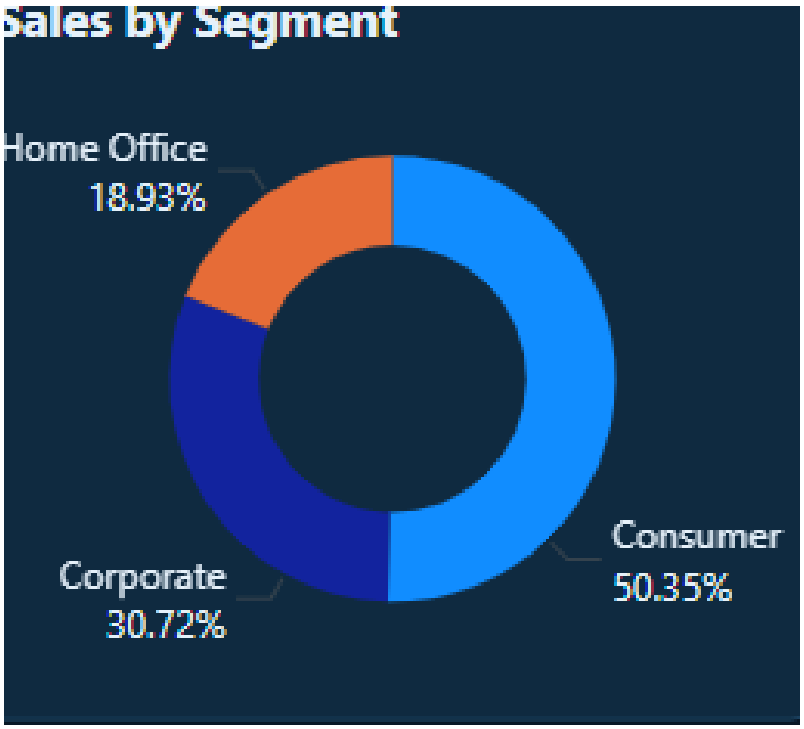

Category	Profit shown	Interpretation
Technology	136K	Highest profit among the three categories.
Office Supplies	121K	Second-highest profit and close to Technology.
Furniture	19K	Much lower profit despite representing 32.34% of sales.

Interpretation: Technology generates approximately 136K profit and Office Supplies about 121K. Furniture generates only about 19K. This is an important finding because Furniture accounts for 32.34% of sales but contributes a much smaller amount of profit.

Business use: Review Furniture product costs, discounts, shipping expenses, returns, and pricing. The objective is not simply to increase Furniture sales, but to understand and improve its profitability. Check product-level margins before making pricing or assortment changes.

Presentation line: “Technology is the most profitable category, followed by Office Supplies. Furniture has a large share of sales but a comparatively low profit contribution, so its costs, discounts, and pricing should be investigated.”

7. Sales by Segment — doughnut chart

What the chart shows: It displays the percentage of sales contributed by three customer segments: Consumer, Corporate, and Home Office.

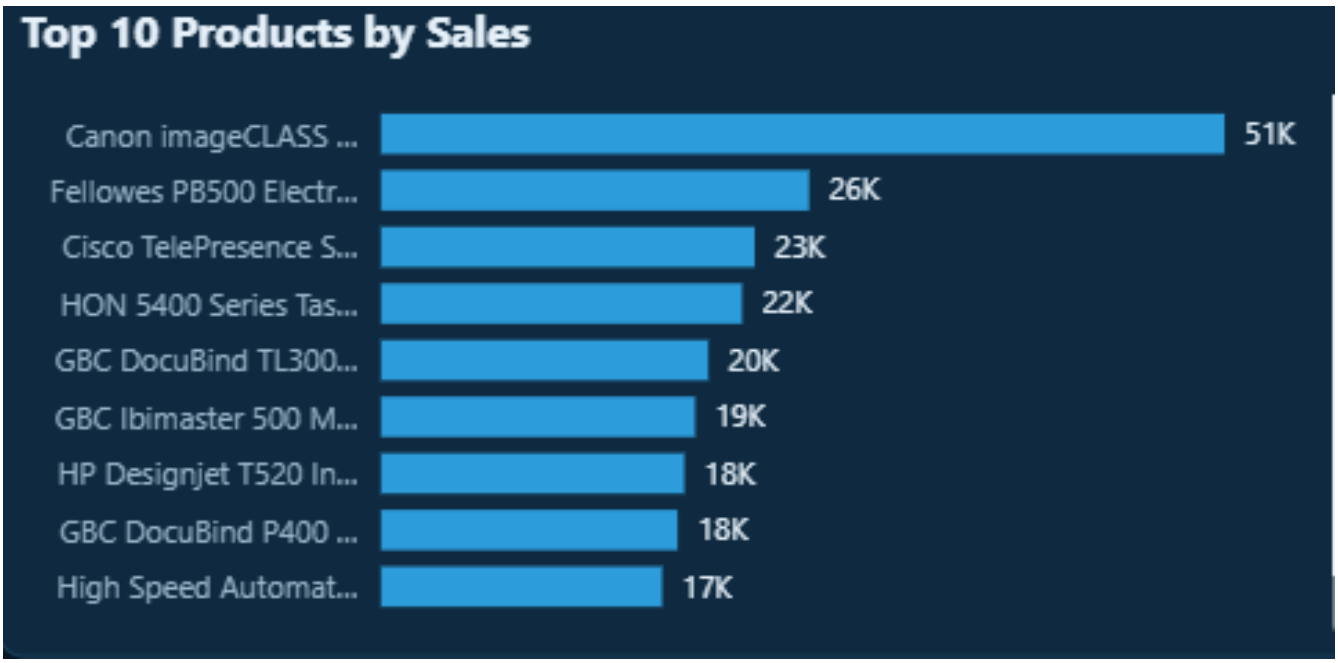

Segment	Share of sales	Interpretation
Consumer	50.35%	Largest segment; accounts for about half of displayed sales.
Corporate	30.72%	Second-largest segment.
Home Office	18.93%	Smallest of the three segments.

Interpretation: Consumer customers contribute 50.35% of sales, making this the largest segment. Corporate contributes 30.72%, while Home Office contributes 18.93%.

Business use: Understand which products and promotions work best for Consumer customers. At the same time, assess whether Corporate and Home Office customers have potential for larger orders, repeat purchases, or targeted offers.

Presentation line: “Consumer customers contribute just over half of total sales. Corporate is the next-largest segment, followed by Home Office. Sales and marketing plans can be tailored to the needs of each group.”

8. Top 10 Products by Sales — horizontal bar chart

What the chart shows: The horizontal bars rank products by sales value. Longer bars indicate products with higher sales. The labels are truncated in the screenshot, so the product names below are written as they appear or as readable portions.

Visible product label	Approx. sales
Canon imageCLASS …	51K
Fellowes PB500 Electr…	26K
Cisco TelePresence S…	23K
HON 5400 Series Tas…	22K
GBC DocuBind TL300…	20K
GBC Ibimaster 500 M…	19K
HP Designjet T520 In…	18K
GBC DocuBind P400…	18K
High Speed Automat…	17K

Interpretation: Canon imageCLASS is the strongest visible product at approximately 51K in sales. The next visible product is Fellowes PB500 at about 26K. The remaining visible products contribute approximately 17K–23K each. The top product therefore stands well above the other visible entries.

Business use: Protect availability of high-selling products by monitoring stock levels and replenishment lead times. However, rank products by profit as well as sales before deciding which items deserve the most attention. A high-sales product may have a low margin.

Note: The chart title says “Top 10”, but the supplied screenshot visibly shows nine readable product rows. The tenth row may be outside the captured area. Use the underlying dashboard or data table to confirm the complete list and full product names.

Presentation line: “Canon imageCLASS is the leading visible product by sales, at approximately 51K. The chart helps identify products that contribute strongly to revenue and should be monitored for stock availability.”

9. Filter controls — how to use them

The top of the dashboard contains four slicers:

- **Year:** Select 2023 or 2024 to view the chosen year's performance.
- **Region:** Select a region to compare sales and other KPIs for that geography.
- **Category:** Focus the dashboard on Furniture, Office Supplies, or Technology.
- **Segment:** Focus on Consumer, Corporate, or Home Office customers.

When a slicer is changed, check whether all KPI cards and charts update as expected. For a fair comparison, compare the same year, region, category, and segment settings across the views being analysed.

10. Overall business findings

- **Revenue:** The dashboard shows approximately 2M total sales, supported by 4,627 orders and 35K units.
- **Profitability:** Total profit is shown as 275K and the reported profit margin is 12.9%.
- **Regional performance:** West and East are the two leading regions by sales; South is the lowest in the displayed comparison.
- **Category mix:** Sales are distributed relatively evenly across Technology, Furniture, and Office Supplies, with Technology slightly ahead.
- **Category profit:** Technology and Office Supplies generate most of the visible profit. Furniture's profit is comparatively low relative to its sales share.
- **Customer mix:** Consumer is the largest segment, contributing 50.35% of sales.
- **Product performance:** Canon imageCLASS is the strongest visible product by sales.

11. Recommendations based on the dashboard

- Investigate Furniture's low profit contribution by checking product costs, discounts, freight, returns, and selling prices.
- Maintain adequate stock for high-selling products, especially the leading products shown in the ranking.
- Study sales patterns in the monthly trend and plan purchasing and promotions around recurring high- and low-sales periods.
- Review South and Central region performance to understand local demand, product availability, and sales coverage.
- Create separate sales and marketing approaches for Consumer, Corporate, and Home Office customers.
- Track both sales and profit when evaluating products and categories; revenue alone does not show profitability.

12. Data checks and interpretation notes

The screenshots display rounded figures. As a result, some totals may not reconcile exactly when values are added or recalculated from the visible labels. For example, the regional labels add to approximately 2.14M, while the Total Sales card is displayed as 2M. This may be caused by rounding, filter context, or a difference in how the visuals are calculated. Verify the exact unrounded values in the underlying dataset or BI measures before presenting a precise reconciliation.

Similarly, 275K profit divided by a rounded 2M sales figure does not exactly reproduce the displayed 12.9% margin. The dashboard may calculate the margin from unrounded values or a specific measure definition. Confirm the formula used for Profit Margin before treating it as a simple ratio.

The monthly chart's labels are small and rotated, and the product names are shortened. For a formal report, use the source dashboard to confirm exact month labels, the full time period, the complete top-10 product list, and exact product names.

13. Short overall explanation for a presentation

"This Superstore Sales Dashboard provides an overview of sales and profitability. It shows approximately 2 million in sales, 275 thousand in profit, 4,627 orders, and 35 thousand units sold. The monthly trend shows fluctuations in sales over time. West and East are the leading regions. Technology has the largest sales share and the highest category profit, while Furniture has a comparatively low profit contribution despite a substantial share of sales. Consumer customers account for just over half of sales, and Canon imageCLASS is the leading visible product by sales. These insights can help the business improve inventory planning, regional strategies, product availability, and category profitability."
